FIELD COURSE

Barrier Beach, Strandplain and Estuary Environments of the Mesotidal Oregon Coast

Dates	October 2014
Registration Fee	\$1,600 CDN plus GST
Instructor	Gerry Reinson

This four-day field seminar takes place on the northern coast of Oregon, from the mouth of the Columbia River southward to Tillamook Estuary. The course is designed to illustrate the various beach, nearshore, and estuary environments that can be encountered along high-energy wave-dominated mesotidal shoreline systems. These modern environments are examined in the context of developing models for use in interpreting ancient clastic sequences in the Western Canada Foreland Basin and in foreland basins elsewhere.

This course is undertaken on a company exclusive basis only. Registration is restricted to 14 participants (a minimum 9 required). For information or to register your company group for this course, please contact:
